Please replace the paragraph (Abstract) beginning at page 43, line 1 with the

following rewritten version:

ABSTRACT

A sealing ring (29) is provided between a an end plate (26A) of an eccentric rotation body

(21) and a support plate (17) so that the <u>a</u> pressure of fluid at high pressure is allowed to work

on the end plate (26A), thereby allowing an axial-direction pressing force to work on the end

plate (26A). The sealing ring (29) is arranged eccentrically away from the <u>a</u> center of a

cylinder (21) as forming the eccentric rotation body (21) to minimize separation of the axial-

direction pressing force from a thrust load in the a radial direction in the end plate (26A) of

the eccentric rotation body (21), thereby reducing turnover moment effectively.
